Estimated insert size: 83944; sum-of-contids estimation
Duality coverage: 6.34 in 020 bases; pulse field qel estimation

* NOTE: This is a 'working draft' sequence. It currently

* romsists of 7 contigs. Gaps between the contigs

* are represented as runs of N. The order of the picres

* to the qaps between them are based on estimates that have

* provided by the submittor.

* This sequence will be replaced

* the accession number will be preserved.

* the accession number will be preserved.

* NOTE: This is a "working draft' sequence. It currently

* consists of 29 contigs. The true order of the pieces

* is not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* runs of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will

* be preserved.

Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         NOTE: This is a 'working draft' sequence. It currently consists of 23 contigs. The true order of the pieces is not known and their order in this sequence record is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Insert size: 164000; agarose-fp

CBIO 1SA, UK. E-mail enquiries: humquery@sanger.ac.uk Clone requests: clonereques(@sanger.ac.uk on Jul 4, 2001 this sequence version replaced gi:14329554.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations where differences are found these are annotated as variations together with a note of the overlapping clone, as we submit sequences with corresponding to the overlapping clone, as we submit sequences with conly a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate regions were either double-stranded or sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone: and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em., EMBL; Sw., SWISSPROT; Tr., TREMBL; Wp., WORMPEP; Information on the WORMPEP database can be found at the formation can be found at the constructed by the Sanger Centre Chromosome 10 constructed by the Sanger Centre Chromosome 10 http://www.sanger.ac.uk/HGPC/Chr10 RPII-733D4 is from the library RPCI-11.3 constructed by the group of Plater de Jong.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              NOTE: This is a 'working draft' sequence. It currently consists of 3 contigs. The true order of the pieces is not known and their order in this sequence record is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DB 2; Length 159135;

This gene was isolated from a bovine substantia nigra cDNA library. The sequence isolated was 2340 nucleotides in length and encoded a predicted protein of 691 residues with an unglycosylated molecular weight of approx. 70,000. This is consistent with size estimates of DAT by photosiffinity probes and SDS gel electrophoresis. The DAT protein is useful in a drug composition for treating psychotic syndromes. The DAT gene can be useful in gene therapy and
This sequence encodes the D-sorbitol dehydrogenase of the invention. Cells transformed with a vector containing DNA encoding the dehydrogenase can be used to produce L-sorbose or 2-keto-f.gulonic acid as precursor for simple large-scale L-ascorbic acid production.

The present sequence represents a human polynucleotide sequence, which is used in the method of the invention. The specification describes a method which uses at least one polypeptide or polynucleotide sequence belonging to the perlecan, precursor of the retinol-binding plasma protein, precursor of the ganglioside GM2 activator, calquanulin B or saposin B protein families. The method is used for detecting, precursor of the ganglioside GM2 activator, calquanulin B or preventing or treating a dependenting or neurological and/or auto-immune disease. The polynucleotides and polypeptides are used for diagnosis, prevention and treatment of multiple scierosis (in its disease, the polynucleotides and polypeptides are used for diagnosis, carious forms and phases). They may also be useful in cases of captured polyarthritis and lupus erythematosus, including use as vaccines and in gene therapy (expression of sense or antisense sequences). They can also be used to assess efficacy of potential therapeutic agents, particularly compounds that reduce or inhibit

The present invention describes primer sets for synthesising 5602
[11] length cONAs defined in the specification. Where a primer set
[12] comprises: (a) an oligo-dT primer and an oligonucleotide complementary
[13] comprises an oligo-dT primer and an oligonucleotide complementary
[14] complementary strand of a polynucleotide which complementary
[15] coligonucleotide comprises at least 15 nucleotides; or (b) a combination
[16] of an oligonucleotide comprises at least 15 nucleotides; or (b) a combination
[17] or an oligonucleotide comprises a 5'-end
[18] complementary strand of a polynucleotide which comprises a 5'-end
[18] sequence and an oligonucleotide or printies a 5'-end
[18] sequence and an oligonucleotide comprises at 1 least 15 nucleotides and the complementary
[18] comprises at least 15 nucleotides and the complementary
[18] complementary areas at least 15 nucleotides and the complementary
[18] complementary area useful for synthesisising polynucleotides,
[18] complementary fine primers are useful for synthesisising polynucleotides,
[18] caper threapy. The primers are useful for the
[18] caper threapy. The primers are useful for the proteins encoded by
[18] checkling and/or diagnosis of the abnormality of the proteins encoded by
[18] checkling and or any specialised methods. AAH03166 to AAH1878 and
[18] AAH18633 to AAH18742 represent human cDNA sequences; AAH246 to
                                          0

```
gene which contains a transcribed polymorphic GGG repeat. Albellocation and transcribed polymorphic GGG repeat. Albellocation of the GGC repeat are associated with diseases related with protein (especially polyalanine) accumulation in the mucleus. This is the first description of short trinucleotide repeat expansions causing a human disease. The specification also describes a method for the cuitage of adjacence associated with protein accumulation in the nucleus, comprising obtaining a mucleicacid sample from the patient and determining allelic variants of the GG repeat of the RAB II gene, wherein long allelic variants (245 to 263 bp in longth) are indicative of a disease related with protein accumulation in the nucleus, Allelic variants of the GG repeat of the human RAB II gene are associated with a disease related with swallowing difficulties and protein (preferably polyalanine) accumulation in the nucleus, especially coulopharymgeal muscular dystrophy. The methods can be used to diagnose such diseases, and to develop therapeutics. The present sequence
                                                                                                                                                                 .;
0
AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification of the present invention.
                                                                                                                                                                                                                         The specification describes a human poly(A) binding protein (PAB) II
                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence is that of the rubella RA27/3 genome.

The nucleic acid can be used to identify further attenuated strains of rubbla virus, by sequencing putative strains and determining whether specific attenuating mutation sites are present by comparison with the sequence of RA27/3. Such strains, and the nucleic acid sequence, are useful in vaccines against rubella virus, an important human pathogen. Whilst acute infection is usually benign, infection during early prepancy can result in viral passage across the placenta and replication in the foetus, causing severe birth defects (congenital rubella syndrome, CRS). Eight live attenuated rubella virus vaccines to prevent CRS have previously been developed by serial passage through culture, and vaccine comprising the RA27/3 strain is the most

The present sequence encodes a chimeric fusion protein of the invention. The specification describes a chimeric pIX protein having at least one adenoviral pIX domain and a non-native amino acid sequence. The
commonly used. Genetic characterisation of RA27/3 is also important to assure that the sequence (and therefore the attenuated phenotype) is maintained during vaccine production, and to determine whether complications sometimes occurring after vaccination (e.g. chronic arthritis) are of wild-type or vaccine origin. The nucleic acid may also be used to identify specific attenuating mutation sites, by introducing RA27/3-specific ancleotides into a wild-type infectious clone (e.g. an existing infectious clone based on the Therien strain) and determining whether the resulting virus is attenuated. It may also be used to express RA27/3 in recombinant host cells, by transfecting host cells with the expression vector containing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        5986 glggacccccgccgagglgggcttgltcggcttccacatcccggtgaagcatgtgagcac 6045

The specification describes a chimeric pIX protein having at least one adenoviral pIX domain and a non-native amino acid sequence. The non-native sequence is a ligand that binds to a substrate present on surface cells. The chimeric proteins are used for producing adenovirus gene transfer vectors.
non-native sequence is a ligand that binds to a substrate present on surface cells. The chimeric proteins are used for producing adenovirus gene transfer vectors.

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oliyo-dr primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide comprises at least 15 nucleotides or (b) a combination of an oligonucleotide comprises a least 15 nucleotides or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprises a 3'-end sequence. Where the oligonucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of the specification. The primer sets can be used in antisense therapy and in gene therapy. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the particularly without any specialised methods. Ani03166 to AANI3628 and AANI3633 represent human amino acid sequences; and AANI3629 to AANI3632 of the present plumpur anino acid sequences; and AANI3629 to AANI3632 of the present plumpur anion acid sequences; and AANI3629 to AANI363200 of the present plumpur anion acid sequences; and AANI3629 to AANI36320 of the present plumpur anion acid sequences; and AANI3629 to AANI36320 of the present plumpur anion acid sequences; and AANI36320 to AANI36320 of the present plumpur anion acid sequences; and AANI36320 to AANI36320 of the present plumpur anion acid sequences and acceptance to the present plumpur anion acid sequences and acceptance to the present plumpur acceptance 
                                                                                                                                                                                     Human; primer; detection; diagnosis; antisense therapy; gene therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the

represent oligonucleotides, all of which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence encodes the herpes simian monkey B virus yB glycoprotein (UL28), and a portlion of an ICP IB.5 Kba protein (UL28), as well as some non-coding sequences. The sequence has been used as basis for the development of differential diagnostic tests for rapid testing of suspect B virus cases in humans and monkeys. Comparison of the B virus yB proteins-ylycoprotein sequence with sequences of gBs of other primate alpha-herpes viruses allows dientification of reagons which are strongly conserved among all primate alpha-herpes viruses and other regions which are highly divergent among them.
                                                                                                                                                                                                                                                                                                    61 coccetegggageaggageageaceceageegeageecegetggtaagtggaeeeeg 119

Where a primer set comprises: (a) an oligo-dT primer and an oligoauclectide comprises one of to the complementary strand of a polynuclectide which comprises one of the 5602 nucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonuclectide comprises a sequence complementary to the compress at least 15 nucleotides; or (b) a combination of an oligonuclectide comprising a sequence complementary to the sequence and an oligonuclectide comprises a 3 'end sequence. Or oligonuclectide which comprises a 5'-end sequence of polynucleotide which comprises a 1'end sequence. Or oligonuclectide which comprises a 1'end sequence. Or the sequence, 3'-end sequence, 3'-end sequence is selected from those defined in the specification. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length without any specialised methods. The invention uses these DNA and protein sequences as a basis for the development of differential diagnostic tests for the rapid identification of Simian herpesvirus B cases. Therefore, the virus can be detected by detecting the DNA sequence and knowledge of the amino acid sequence will help in the antibody production.

The specification describes a recombinant adenovirus that raises an dimmune response against rabies. The adenovirus has a functionally disrupted El region and includes an expression cassette containing DNA that encodes rables glycoprotein, linked to control sequences functional in eukaryotic cells. The adenovirus is used in vaccines against rabies, particularly oral vaccines for protecting wild animals that are vectors of the disease. Incorporation of an intron into the adenovirus prevents homologous recombination with El regions endogenous to have cells. The adenovirus. The present sequence represents a recombinant rabies adenovirus construct AdBHGEB3CA13(1)RG.

This sequence represents the national and Elb regions of the viral genome, which are involved in the early stages of viral replacements and enonvirus A Serctype. The Ela and Elb regions of the viral genome, which are involved in the early stages of viral replication and which are involved in the early stages of viral replication replication. The cystic fibrosis transmembrane conductance regulator (CFTR) coding sequence is inserted into the genome in place of the Ela/Elb region and transcription of the CFTR sequence is driven by the endogenous Ela promoter. This is a moderately strong promoter that is functional in a variety of cells. This adenovirus retains the E3 viral coding region. As a consequence that the growth of the adenovirus-CFTR DNA is greater than that of wild type adenovirus. This renders the DNA more difficult to package and means that provide the missing Ela and Elb functions. The E3 region encodes a number of proteins, including pl9 which is believed to interact with and prevent presentation of MHC class I proteins. This property prevents recognition of the including may allow viral latency. This adenovirus may be administered to the pulmonary airways in the gene therapy of cystic fibrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

Not I site of insertion for second gene; cytomegalovirus (CMV) early promoter/enhancer; splice donor and splice acceptor; Hind III site; stuffer site for CDNA insertion; Sal I site; mouse beta globin polyadenylation sequence; Ad 5 genome sequence. The plicing elements are from MA-IS Cat. The plasmid vector is converted into a recombinant adenovirus for expression of a heterologous gene(s) and/or gene product(s) in a mammalian cell.
